

Telegram System Events: The Cross-Platform Reference

Every system event Telegram can record in a chat, on both iOS and Android, with what each one means, what the clients call it on each platform, and which ones the LEAPPs parsers decode in detail.

Alexis Brignoni
Updated August 4, 2026

Live version: leapps.org/blog-post?post=2026-08-04-telegram-system-events-reference

This is the companion to [Telegram on Both Sides](#), which covers what iLEAPP and ALEAPP now parse out of Telegram. This one answers the narrower question that comes up in casework: what system events can Telegram even record, and what do they mean?

[Download the printable PDF edition.](#)

Telegram does not only store what people typed. It stores events. Somebody was added to a group. A screenshot was taken. The history was cleared. The auto-delete timer moved from off to twenty four hours. A call happened, and it was missed rather than answered. Those live in the message table alongside the chat text, and they are frequently the records that answer the question you actually have.

Why this document exists

The two clients name the same event differently.

That sounds like trivia until you are reading an iLEAPP report and an ALEAPP report side by side. A user being added to a group is `addedMembers` on iOS and `ChatAddUser` on Android. A screenshot in a secret chat is `historyScreenshot` on one and `ScreenshotTaken` on the other. Content protection is `copyProtectionToggle` here and `NoForwardsToggle` there.

I checked how bad it is. Of roughly seventy distinct events, **matching the two lists by name alone pairs only 27 of them**. The rest are the same concept wearing different clothes. So if you work both platforms, and most of us do, you need a translation table, and as far as I can tell nobody had published one.

How this was built, and how far to trust it

The two per-platform lists are extracted from the clients' own published source, not retyped: the iOS ordinals come from `SyncCore_TelegramMediaAction.swift`, and the Android constructors come from the generated `TlGen_MessageAction.kt`. A script in the site repository does the extraction so this page can be refreshed rather than rewritten. That matters more than it sounds: iLEAPP's own copy of the iOS list had drifted twenty entries out of date before this work, and Telegram keeps adding events.

Every event name in the tables is a link to the line of Telegram's source that defines it. Do not take my word for any row. Click the name and read the client's own code.

Those links are pinned to a specific commit rather than to `main`, on purpose. Line numbers move with every upstream edit, so a link to `main` would keep working while quietly pointing at the wrong line, which is worse than a broken link. The iOS side is pinned at `3344a18d3cdc` and the Android side at `9bcf3d2769c6`. When this reference is refreshed, the script re-pins both and every line number is re-derived.

The cross-platform pairing is the part a machine cannot do. String matching gets you 27. The remaining pairs were mapped by hand and reviewed. Where I could not find a counterpart, the row says so with a dash rather than guessing.

As of the source on August 4, 2026: **iOS defines 64 event types** with ordinals up to 65, and **Android defines 68**, spread across 107 constructors because Android versions each event per protocol layer. 62 pair across platforms.

Three things to keep in mind before any of this goes in a report:

- **A name is not proof.** These tables tell you what the record type means. Whether the event happened as alleged still depends on the record, the timestamps around it, and your validation.
- **Payload decoded** in the last column means our parsers pull the detail fields out, not merely name the event. A phone call reports its outcome and duration; a timer change reports the new value. Where the column is blank the

event is named but its payload is not broken out.

- **These lists drift.** Refresh from source before relying on the absence of something.

The events

Event names link to their defining line in Telegram's source. Dashes mean the platform has no counterpart under any name I could match. Android constructor counts in parentheses are the additional older layer versions of the same event.

Membership and chat lifecycle

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
groupCreated	1	ChatCreate	0xbd47cbad (+1)	A basic group was created. Carries the title.	iOS/Android
-	-	ChannelCreate	0x95d2ac92	A channel was created. Carries the title.	-
addedMembers	2	ChatAddUser	0x15cefd00 (+2)	One or more users were added to the chat.	iOS/Android
removedMembers	3	ChatDeleteUser	0xa43f30cc (+1)	A user was removed from the chat.	iOS/Android
photoUpdated	4	ChatEditPhoto	0x7fcb13a8	The group or channel photo was changed.	-
-	-	ChatDeletePhoto	0x95e3fbef (+1)	The group or channel photo was removed.	-
titleUpdated	5	ChatEditTitle	0xb5a1ce5a	The group or channel name was changed.	iOS/Android
joinedByLink	7	ChatJoinedByLink	0x031224c3 (+1)	A user joined via an invite link. Names the inviter.	iOS/Android
joinedByRequest	25	ChatJoinedByRequest	0xebbca3cb	A user joined after an admin approved their request.	-
peerJoined	19	ContactSignUp	0xf3f25f76 (+1)	A contact from the address book joined Telegram.	-
joinedChannel	38	-	-	The user joined the channel.	-
channelMigratedFromGroup	8	ChannelMigrateFrom	0xea3948e9 (+1)	This channel was converted from a basic group.	-

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
groupMigratedToChannel	9	ChatMigrateTo	0xe1037f92 (+1)	This group was upgraded to a supergroup.	-
groupCreatorChange	59	ChangeCreator	0xe188503b	Chat ownership was transferred.	-
-	-	NewCreatorPending	0xb07ed085	A transfer of chat ownership is pending confirmation.	-
communityChanged	65	ChangeCommunity	0x5d20bae8	The chat was moved into or out of a community.	-
pinnedMessageUpdated	6	PinMessage	0x94bd38ed	A message was pinned in the chat.	-
topicCreated	28	TopicCreate	0x0d999256	A forum topic was created.	-
topicEdited	29	TopicEdit	0xc0944820 (+1)	A forum topic was renamed or reconfigured.	-

Calls

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
phoneCall	14	PhoneCall	0x80e11a7f	A one-to-one voice or video call. Carries call id, outcome and duration.	iOS/Android
groupPhoneCall	22	GroupCall	0x7a0d7f42	A group voice chat. Carries the call id and duration.	iOS
-	-	GroupCallScheduled	0xb3a07661	A group call was scheduled for a future time.	-
inviteToGroupPhoneCall	23	InviteToGroupCall	0x502f92f7 (+1)	Users were invited to a group call.	Android
conferenceCall	48	ConferenceCall	0x2ffe2f7a	A conference call. Carries duration and participants.	iOS

Privacy, security and retention

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
historyScreenshot	11	ScreenshotTaken	0x4792929b	A screenshot was taken in a secret chat.	-

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
historyCleared	10	HistoryClear	0x9fbab604	The chat history was cleared.	-
messageAutoremoveTimeoutUpdated	12	SetMessagesTTL	0x3c134d7b (+1)	The auto-delete timer was changed. Carries the new value.	iOS/Android
copyProtectionToggle	60	NoForwardsToggle	0xbf7d6572	Content protection (restrict saving) was switched.	iOS
copyProtectionRequest	61	NoForwardsRequest	0x3e2793ba	Content protection was requested.	-
botSentSecureValues	18	SecureValuesSent	0xd95c6154	Telegram Passport data was shared with a bot.	-
botDomainAccessGranted	17	BotAllowed	0xc516d679 (+1)	The user granted a website access via the bot login.	-
botAppAccessGranted	35	BotAllowed	0xc516d679 (+1)	The user granted a bot mini app access.	-
attachMenuBotAllowed	31	AttachMenuBotAllowed	0xe7e75f97	A bot was added to the attachment menu.	-
phoneNumberRequest	20	-	-	A bot requested the user phone number.	-
requestedPeer	32	RequestedPeer	0x31518e9b (+1)	The user shared a peer with a bot on request.	-

Location

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
geoProximityReached	21	GeoProximityReached	0x98e0d697	A proximity alert fired. Carries the distance in metres.	iOS/Android

Payments, gifts and stars

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
paymentSent	15	PaymentSent	0xc624b16e (+2)	A payment was completed. Carries currency and amount.	iOS/Android
-	-	PaymentSentMe	0xffa00ccc (+1)	Bot-side record of a payment received from a user.	-
paymentRefunded	41	PaymentRefunded	0x41b3e202	A payment was refunded.	-
paidMessagesRefunded	46	PaidMessagesRefunded	0xac1f1fcd	Paid messages were refunded.	-
paidMessagesPriceEdited	47	PaidMessagesPrice	0x84b88578 (+1)	The price for paid messages was changed.	-
giftPremium	27	GiftPremium	0x48e91302 (+3)	A Telegram Premium subscription was gifted.	-
giftCode	36	GiftCode	0x31c48347 (+3)	A Premium gift code was issued.	-
giftStars	42	GiftStars	0x45d5b021	Telegram Stars were gifted.	-
giftTon	52	GiftTon	0xa8a3c699	TON was gifted.	-
prizeStars	43	PrizeStars	0xb00c47a2	Stars were awarded as a giveaway prize.	-
starGift	44	StarGift	0xea2c31d3 (+6)	A star gift was sent.	-
starGiftUnique	45	StarGiftUnique	0xe6c31522 (+5)	A unique (collectible) star gift changed hands.	-
starGiftPurchaseOffer	56	StarGiftPurchaseOffer	0x774278d4	An offer was made to purchase a star gift.	-
starGiftPurchaseOfferDeclined	57	StarGiftPurchaseOfferDeclined	0x73ada76b	A star gift purchase offer was declined.	-
giveawayLaunched	37	GiveawayLaunch	0xa80f51e4 (+1)	A giveaway was started in the channel.	-

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
giveawayResults	39	GiveawayResults	0x87e2f155 (+1)	Giveaway results were published.	-
boostsApplied	40	BoostApply	0xcc02aa6d	Channel boosts were applied.	-

Appearance and content

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
setChatTheme	24	SetChatTheme	0xb91bbd3a (+1)	The chat theme was changed.	-
setChatWallpaper	33	SetChatWallPaper	0x5060a3f4 (+1)	The chat wallpaper was changed.	-
setSameChatWallpaper	34	SetSameChatWallPaper	0xc0787d6d	The peer applied the same wallpaper.	-
suggestedProfilePhoto	30	SuggestProfilePhoto	0x57de635e	A profile photo was suggested to the user.	-
suggestedBirthday	55	SuggestBirthday	0x2c8f2a25	A birthday was suggested to the user.	iOS
gameScore	13	GameScore	0x92a72876	A score was posted in a bot game.	iOS/Android
customText	16	CustomAction	0xfae69f56	A server-supplied notice rendered as text.	iOS/Android
webViewData	26	WebViewDataSent	0xb4c38cb5	Data was submitted from a bot web view.	-
-	-	WebViewDataSentMe	0x47dd8079	Bot-side record of data submitted from a web view.	-
managedBotCreated	62	ManagedBotCreated	0x16605e3e	A managed bot was created for the chat.	iOS
-	-	Empty	0xb6aef7b0	A placeholder action with no content.	-

Polls, to-dos and suggested posts

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
pollOptionAppended	63	PollAppendAnswer	0x9da1cd6c	An option was added to a poll.	-

Event (iOS)	iOS value	Event (Android)	Android constructors	What it records	Payload decoded
pollOptionDeleted	64	PollDeleteAnswer	0x399674dc	An option was removed from a poll.	-
todoCompletions	49	TodoCompletions	0xcc7c5c89	To-do items were marked complete or incomplete.	-
todoAppendTasks	50	TodoAppendTasks	0xc7edbc83	Tasks were appended to a to-do list.	-
suggestedPostApprovalStatus	51	SuggestedPostApproval	0xee7a1596	A suggested post was approved or rejected.	-
suggestedPostSuccess	53	SuggestedPostSuccess	0x95ddcf69	A suggested post was published successfully.	-
suggestedPostRefund	54	SuggestedPostRefund	0x69f916f8	A suggested post payment was refunded.	-

Reading the asymmetries

A few of the gaps above are worth a sentence, because they are the sort of thing that looks like a parser bug when it is actually the platform.

Android has ChannelCreate **and iOS does not.** iOS folds channel creation into the migration and group creation events rather than emitting a distinct one.

Android has bot-side twins, PaymentSentMe and WebViewDataSentMe, which record the same transaction from the receiving bot's perspective. You will not see these on a normal user's device.

Empty **exists on Android** as a placeholder with no content. If you see it, it is not a parsing failure.

iOS botDomainAccessGranted **and** botAppAccessGranted **both map to Android** BotAllowed. iOS splits website login from mini app authorization; Android does not.

What the parsers do with these

On both platforms every event in these tables is named in the report rather than shown as an unlabelled system message. That was not true before this summer: iOS was reporting twenty of them as "unknown" because its list had gone stale, and Android was collapsing all of them into one flat label.

The events whose payloads we break out are marked in the last column. The one I would point at first is the phone call, because on Android it turns what used to be an unreadable row into a call log entry with an outcome and a duration.

Corrections welcome

If a pairing here is wrong, or you know the counterpart for one of the dashes, please tell me and I will fix it. The extraction script and the reviewed mapping both live in the site repository, so a correction is a pull request rather than an email into the void.

And since every row links to the source line it came from, you do not have to trust me to check. That is the point.
